

# Aqua Control

*The Beautiful Water Quality Management System*

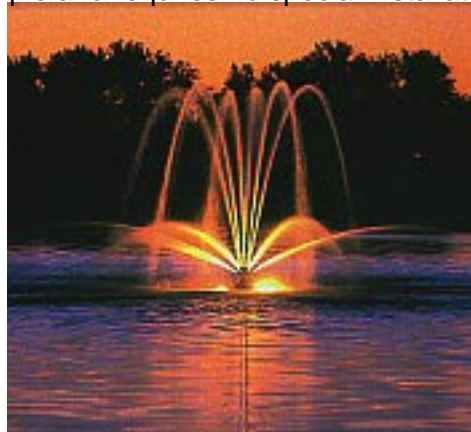

**Combo:** combination of both an Aerator and a Fountain driven by one motor. It is the best of both worlds since it combines effective, high volume, aeration and circulation with a really high and impressive Fountain.

**Fountains** are built with low volume “impeller” pumps that generate high pressures so that spray patterns are big and high, but light volume spray patterns can be generated.

The **vertical** Aerator or Fountain and the Combo sit in the water vertically. This arrangement provides for deep suction which helps provide thorough circulation; it is compact, efficient, simple and requires no special installation.

The **horizontal** aerator or fountain uses the same motor and pump assembly as the vertical but it is arranged horizontally and is provided with floats so that it will remain in a sunken horizontal position. It discharges into an elbow and subsequently into a standard upper tube assembly and is supported by a single float. It is somewhat more expensive and the installation process is slightly more involved.

**Aerators** are built with high volume “propeller” pumps and are used where aeration and circulation are needed to maintain water quality or where the spray pattern desired is very heavy and not high.

- twenty different spray patterns
- 1/2 to 7 1/2 Horsepower
- single and three phase motors
- one and two stage pumps
- lights & accessories.
